BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

**As rescanning documents *will not* correct images,
please do not report the images to the
Image Problem Mailbox.**

ABSTRACT OF THE DISCLOSURE

To provide a transreflective liquid crystal display device that can produce a bright and high-contrast display with a wide viewing angle. A liquid crystal display device has a liquid crystal layer held between a pair of substrates and has a transmissive display region and a reflective display region in one dot region. The liquid crystal layer includes a liquid crystal being initially vertically aligned and having negative dielectric anisotropy. The pair of substrates have electrodes to drive the liquid crystal on sides facing the liquid crystal layer. The electrodes have openings and protrusions in the transmissive display region and the reflective display region, respectively. The opening areas of the openings and the in-plane occupying areas of the protrusions are larger in the reflective display region than in the transmissive display region.
